Unlocking the potential of gene therapy in health

Alexandre MEJAT – Deputy Director & Head of International Scientific Networks, AFM-Téléthon

Gene therapy definition

Gene therapy medicines contain genes that lead to a therapeutic, prophylactic or diagnostic effect.

They work by inserting 'recombinant' genes into the body, usually to treat a variety of diseases, including genetic disorders, cancer or long-term diseases. A recombinant gene is a stretch of DNA that is created in the laboratory, bringing together DNA from different sources.

a) Contains an active substance which is **a recombinant nucleic acid**
b) to regulate, repare, replace, add or suppress a genetic sequence
c) Therapeutic, prophylactic or diagnostic effect.

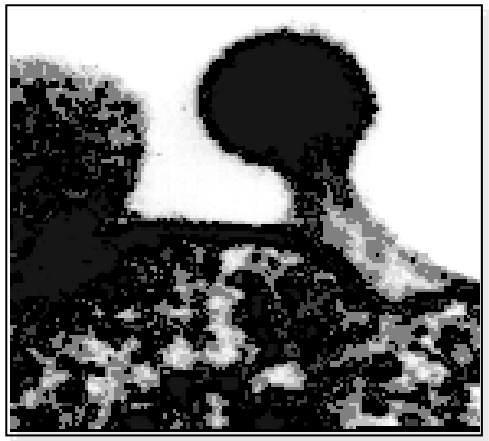
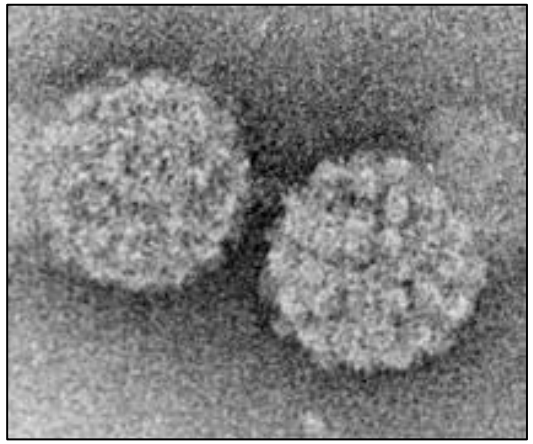
Example of vectors



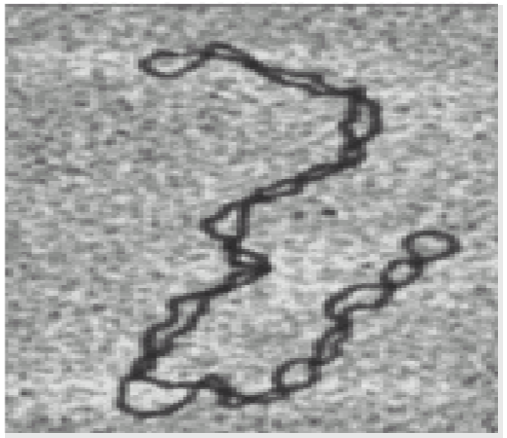
Retrovirus / Lentivirus

- Integrates
- Efficient
- Immunogenic
- Size limitation
- Large scale production



Adeno-associated virus

- Long term (episomal)
- Does not integrate (?)
- Efficient
- Immunogenic
- Size limitation
- Large-scale production



Non-viral

- May be long term
- Does not integrate (?)
- Poorly efficient
- Non-immunogenic
- Large transgenes
- Large-scale production

First gene therapy cure

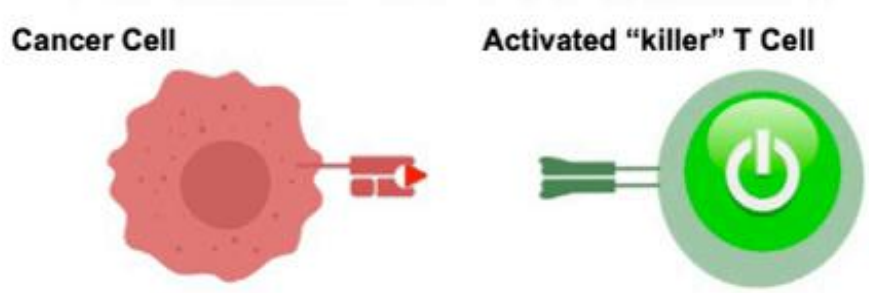
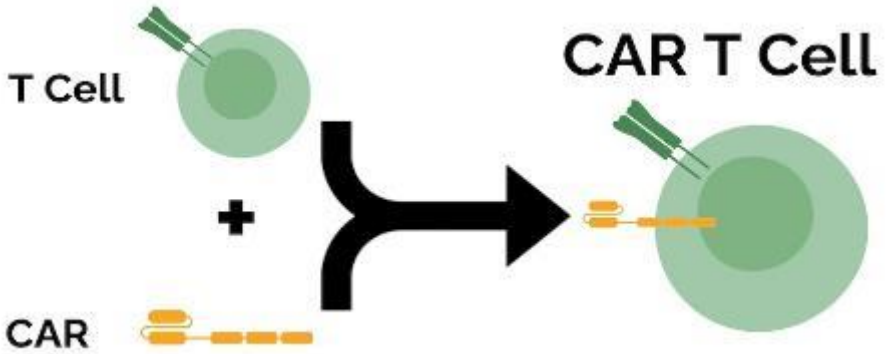
A proof of concept amenable to a number of pathologies

- Immunodeficiencies
- Blood diseases
- Bone diseases
- Adrenoleukodystrophy
- Cancer immunotherapy

From *ex vivo* gene therapy… to CAR-T cells



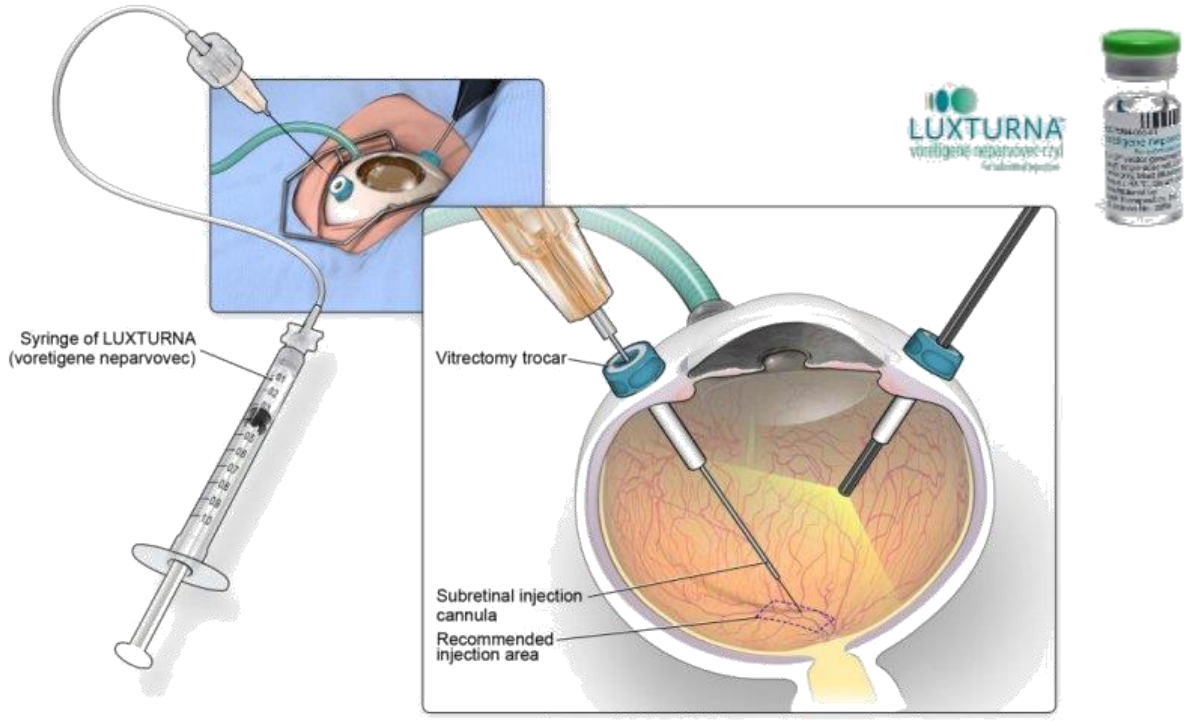


- **Axicabtagene ciloleucel** (YescartaTM): CD19; lymphoma
- **Brexucabtagene autoleucel** (TecartusTM): CD19; leukemia and lymphoma
- **Idecabtagene vicleucel** (AbecmaTM): targets B lymphocyte maturation antigen, multiple myeloma
- **Lisocabtagene maraleucel** (BreyanziTM): CD19, lymphoma
- **Ciltacabtagene autoleucel** (CarvyktiTM): BCMA, multiple myeloma

- Zevorcabtagene Autoleucel (Zevor-Cel, CT053): CAR-T, multiple myeloma

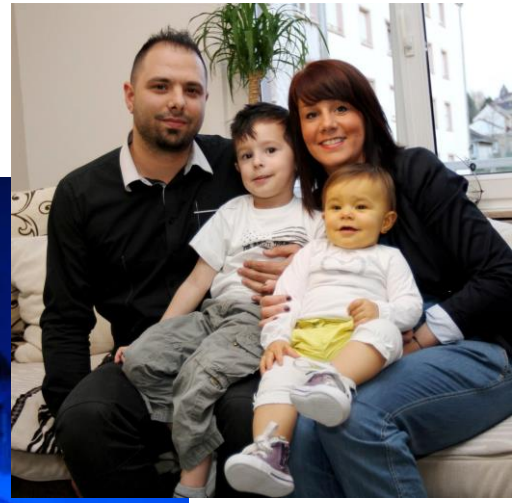
From *ex vivo* gene therapy … to local delivery

2011



Leber's Congenital Amaurosis

From local delivery … to systemic delivery



Crigler-Najjar syndrome is a rare and serious disease caused by a deficiency of the liver-specific enzyme UDP-glycosyltransferase 1 polypeptide A1 (UGT1A1), leading to a potentially fatal accumulation of unconjugated bilirubin in serum and all body tissues, which becomes toxic in the brain.

Currently, the only treatment is phototherapy.

In vivo gene therapy SAE overview

Type of disease	Immune-related adverse events observed	Other SAE that may involve immune reactions	Gene therapy drug
Duchenne dystrophy	Myocarditis/Myositis	Mid transaminitis Mid transaminitis	PF-06939926 SRPT9001 GNT0004
	Atypical Hemolytic Uremic syndrome (aHUS)	Mid transaminitis	SGT-001 PF-06939926
SMA	Thrombotic microangiopathy (TMA*) Hemophagocytic lymphohistiocytosis (HLH)	Mid transaminitis	ZolgenSMA®
Myotubular myopathy		Fatal hepatotoxicity	AT132
CNS disorders	_	DRG toxicity	ALS and GAN AAV GT
Blood/coagulation disorders		Mid transaminitis	Almost all

Immune reactions
Innate reactions
(i.e. complement activation)

Preexisting Ab → ineligible patients
Loss of efficacy, prevent redosing

The need for innovation in gene therapy manufacturing

- **Vaccine:** **10^7 viral particles/dose**
- **Leber's Congenital Amaurosis:** **10^{11} vg/patient**
- **Duchenne / SMA :** **10^{15} to 10^{16} vg/patient**

treating only incident patients in Europe with the current technologies would require >500 AAV lots of 200 L per year.
Each batch € 0,5 M to € 1M worth.

Forecast: Annual viral vector bioreactor needs for gene therapy

	Annual demand (clinical+commercial)
Liters bioreactor capacity needed (LV+AAV)	**285,000,000**
Number of 10, 20 and 50L bioreactors required	**5,200,000**
Number of 2000L bioreactors required	**1,500**
